VERIXA IDP

Turn document data into a useful next step.

Verixa IDP extracts fields and tables for people to check against the original document, correct and prepare for downstream use. Software, equipment and deployment services can be scoped to your needs.

From documents to usable data

01
Provide files
Start with PDF or scanned orders

02
Extract data
Read fields and table content

03
Review
Check the source and correct results

04
Prepare output
Assess export and API integration

Validate one document workflow first

Purchase orders
A fixed order example on the website illustrates the workflow.

Invoices and forms
Candidate use cases; formats, fields and results require sample validation.

Choose a deployment approach

GB10 workstation
Assess a single-machine setup. Models, capacity and performance require testing.

On-premise server
Deploy in your environment. Size the system around workload and infrastructure.

Dedicated compute
Assess rented compute. Agree data flows, operations and service scope.

Bring four inputs to the first discussion

Sample documents and target fields / Daily volume and users

Destination systems / Deployment and data-access requirements

Document support, results, features, hardware, licensing and integrations are subject to project assessment. Purchase, rental and software needs are scoped separately.
